

Global Relief System Helping in Tenn. Floods

Saturday, May 8, 2010

PORTSMOUTH – Global Relief Technologies had deployed its Rapid Data Management System with the American Red Cross to assist in recovery efforts following the deadly storms and flash floods in Tennessee.

Emergency response teams are equipped with the firm's handheld PDA's, which are already loaded with RDMS technology, including satellite imagery of Tennessee's flood zone. Information collected by relief workers on the ground is automatically transmitted, organized and shared on a collaborative website where various agencies can access and share the findings.

Link to deployments, photos and detail of GRT's current work around the world:
